2D GAME PROGRAMMING FOR THE WEB

Nicholas Zinn, June 2020

TABLE OF CONTENTS

- Introduction to 2D Games
- What is a Scene, Sprite, Sprite Sheet, Tile?
- The Game Loop
- 2D Graphics Canvas
- 2D Math
- User Input
- Circles Dev Environment

INTRODUCTION TO 2D GAMES

Common Features

- Sprite Sheets
- Animation
- Sound Effects
- Input, gamepad, multi-touch
- Parallax Scrolling
- Collision Detection
- Mobile and Desktop Support
- Image filters and effects
- Physics System
- Particle System

Popular Web Graphics and Game Libraries

PixiJS

unity

To teach concepts, we rolled our own, Circles:
https://nickzinn.github.io/circles/

WHAT IS A SCENE?

Opening Sequence

NEW GAME

GAME OVER

Main Game

LEVEL UP

NEXT LEVEL

Level Transition

Scenes allows you to storyboard a game.

WHAT IS A SPRITE?

2D Game Visual Object

Properties
- Position (x,y)
- Size (width, height)
- Vector (speed, angle in radians)

Methods
- paint()
- updateModel()

SPRITE SHEET

- One image file divided into smaller images.
- Used for either animation scenes for one sprite or many individual sprites.
- For animation, need to sequence the flipping of scenes to the time clock.

WHAT IS A TILE?

- Tiles are regular shaped images that used to build the game world or level map.

SpriteSheet of Tiles

Level Map

Painted Screen

THE GAME LOOP

2D GRAPHICS CANVAS

- HTML **<canvas>** element allows 2D graphics and 3D graphics(WebGL) in the browser.

Code

HMTL:

```
<canvas id="my-canvas" width="300" height="300"></canvas>
<div style="display:none;">
  <img id="source" src="sampleImage.jpg">
</div>
```

Javascript:

```
const canvas = document.getElementById('my-canvas');
const ctx = canvas.getContext('2d');
const image = document.getElementById('source');
//Clear Canvas
ctx.fillStyle = 'red';
ctx.fillRect(0, 0, canvas.width, canvas.height);
//Draw Image Scaled to half size in center.
const w = image.width/2, h = image.height/2;
const dX = canvas.width/2 - w/2, dY = canvas.height/2 - h/2;
ctx.drawImage(image,0, 0, image.width, image.height, dX, dY, w, h);
```

2D GRAPHICS CANVAS

Transparency

- pixel = (r, g, b, a)

- Global Alpha

Compositing

globalCompositeOperation

2D GRAPHICS MATH

Canvas Rendering Context 2D

All 2D computer graphics are done on an upside-down cartesian coordinate system.

Vector to X, Y

$$V = hypot(x, y)$$

$$\theta = atan2(y, x)$$

$$V_x = V \cdot \cos\theta$$

$$V_y = V \cdot \sin\theta$$

Vector Addition

Convert each vector to x,y and add together.

USER INPUT

- Input is event based (can't query state, so need to keep track of all input state).
  - Keyboard: keydown, keyup. Need to keep track of key presses to handle key being held down.
  - Mouse: mousedown, mouseup, mousemove. Need to keep track of mouse button to handle mouse being held down.
  - Touch: touchmove, tauchend, touchcancel, touchstart. Need to keep track of touch events.
- Event Handling: Scene.updateModel() triggers event handlers, once per game loop.

CIRCLES DEV ENVIRONMENT

TypeScript

Visual Studio Code
